

iTekLogic For Home

Think you don't need to back up the data on your home computer? Think again!

Think about everything that you store on your home computer, and how your life would be affected if all of that were lost. How will you tell your children that you lost all of the digital photos you've taken of them over the years? What would happen to your home-based business if you lost your customer information or accounting records? How would it affect your grades if your computer crashed and you lost your assignments?

As technology advances, more and more of our lives are becoming dependent on computers. Chances are, your home computer holds most, if not all, of these important types of information:

-

Tax documents

Accounting records

Home-based business records

Take-home work from an offsite job

School work

Digital photos

Home videos

Music files

Important correspondence

Contact information for family, friends, and clients

With iTekLogic's online backup services, you can protect yourself against losing the important information stored on your home computer.

But what do you need to protect yourself from?

There are plenty of threats to the security of your home computer. The more dependent on computers we have become, the more vulnerabilities we have been exposed to. Today, any number of threats can wipe out your home computer and the information stored on it, including:

-

Viruses, spyware, and hackers: The least of these threats may simply cause some annoyances such as slow-running programs, but many viruses will sabotage your entire system, shutting you out of your important files. Online backup ensures that you won't lose your data should the worst happen.

-

Hardware failures: There are many data storage devices to choose from, including upgraded internal hard drives, external hard drives, and USB drives. These items are not invincible, however, and are sure to fail at some point. The question is, when will it happen? Online backup allows you to protect yourself from the unknown.

-

Theft, natural disasters: Being the victim of a burglary or losing your home in a natural disaster is upsetting enough, without losing all of your important information in the process. Make sure you have a way to recover the data you'll need to get on with your life.

-

Operator error: Okay, let's face it – sometimes the culprit is none other than yourself. It's easy to click "yes" instead of "no" when asked if we want to delete or overwrite an existing file. Online backup ensures that such "idiot errors" won't have permanent repercussions.

Protect yourself by backing up your data!

Life is full of surprises, many of them unpleasant. The only way you can protect yourself from losing your important data is to back it up. Keep reading to find out why online backup is your best choice.
